TABLE OF CONTENTS

01

Ticket Volume Trends

High ticket volume during peak months and after hours

02

Source Breakdown

Email is overutilized, while phone is underutilized.

03

SLA Compliance

Significant SLA breaches for first response and resolution.

04

Agent Performance

Uneven performance across agents

Project Overview

To improve the efficiency of the technical support center by analyzing performance against key KPIs such as ticket volume, SLA compliance, and agent performance. The goal is to identify bottlenecks and optimize support operations.

Key Areas:

Ticket Volume Trends

SLA Performance

Agent and Channel Efficiency

Problem Statement

1. Ticket Spikes & Resolution Delays
2. SLA Breaches
3. Agent Performance Discrepancies

Solution Approach:

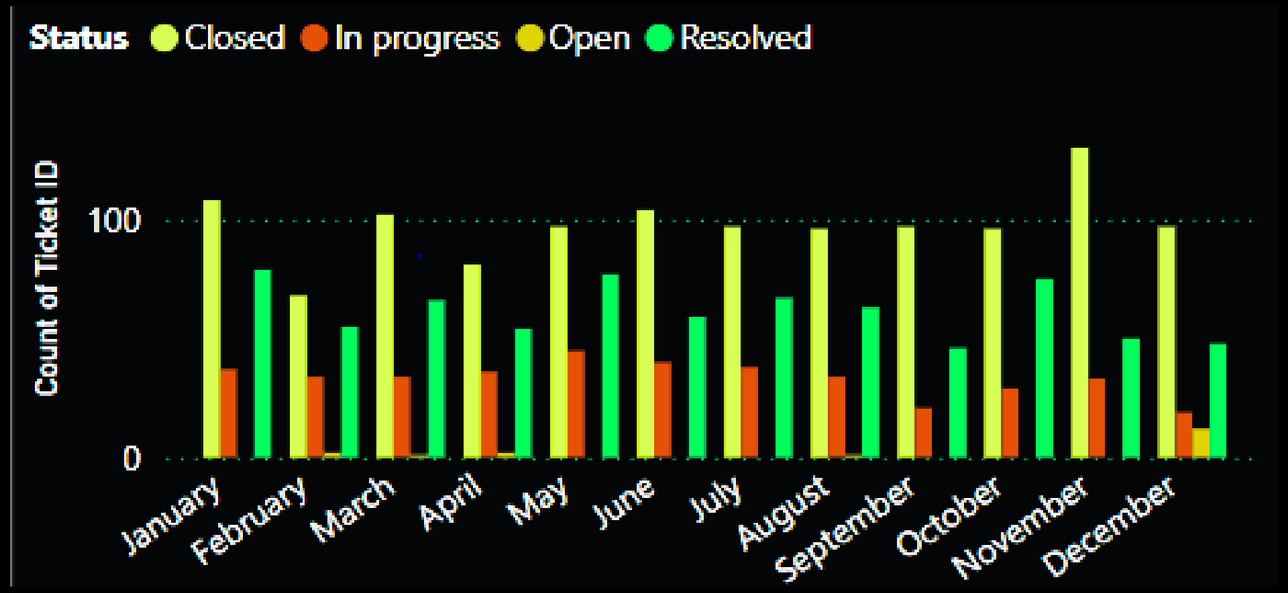
Analyze ticket patterns to adjust staffing and improve after-hours response

Measure SLA breaches to ensure deadlines are met

Review agent performance to improve efficiency and customer satisfaction.

Ticket Volume Trends

Problem:
Identifying spikes in ticket creation across months and hours

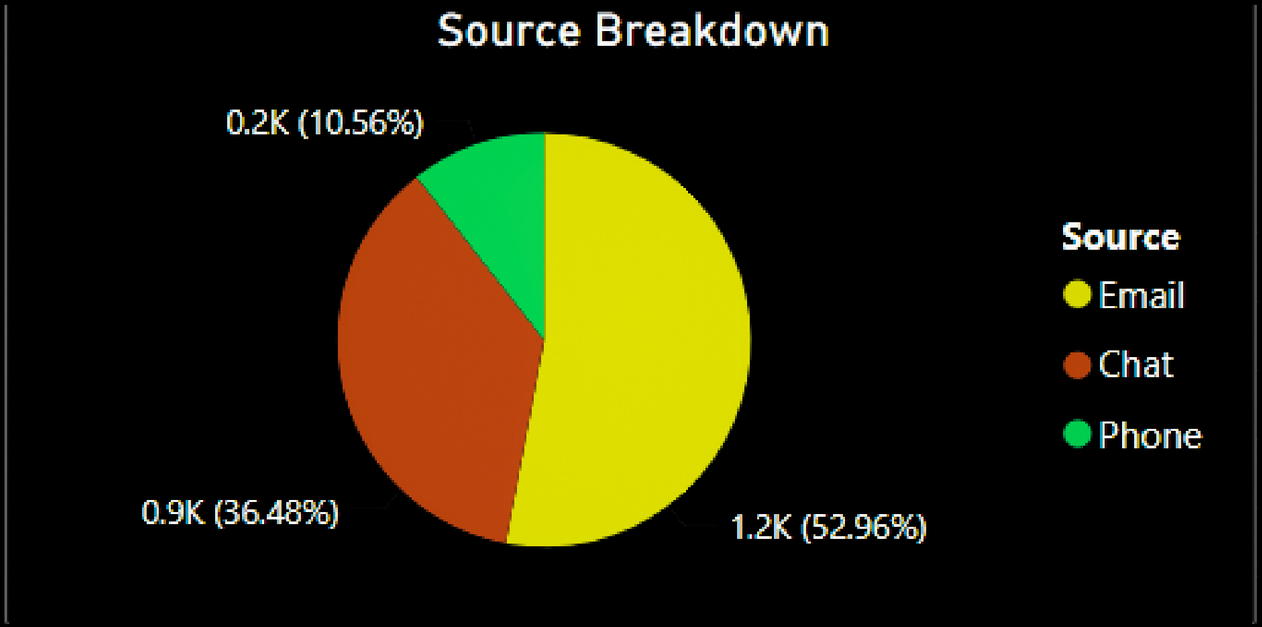


Insights:
Peak Ticket Months: January and June are high-volume months, with a sharp decline in summer months.
After-Hours Problem: A significant increase in tickets during work hours, with reduced handling capacity during after-hours leading to backlogs.

Solution:
Adjust staffing during peak months and create an after-hours team to manage the load.

Source Breakdown

Problem:
Which support channels are most used, and how do they impact resolution times?

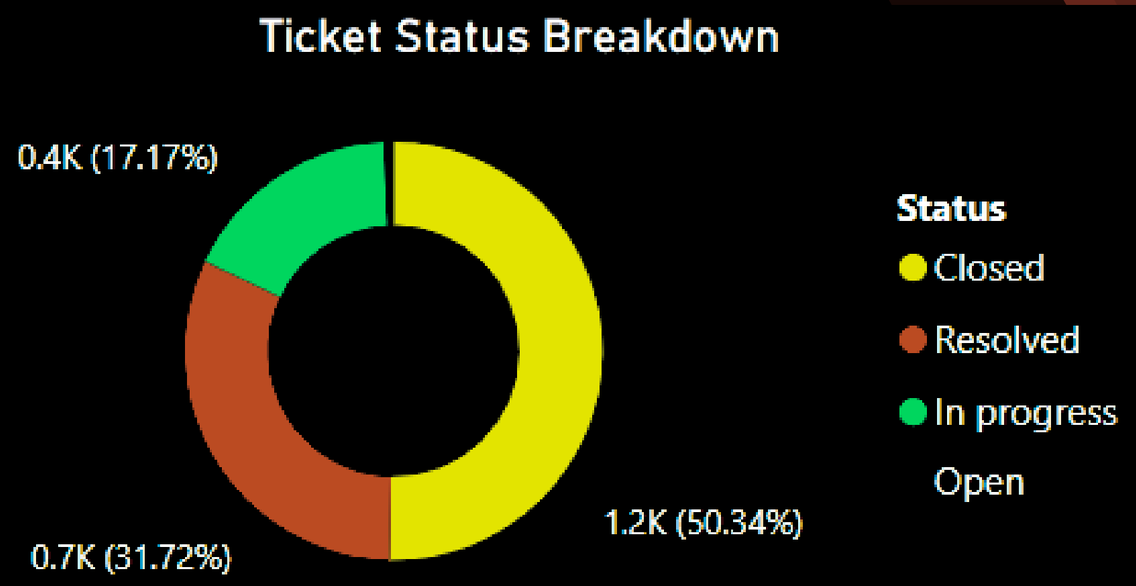


Insights:
Email Dominates: 52.96% of tickets are submitted via email, followed by chat (36.48%).
Phone Lagging: Only 10.56% of tickets come through phone support, which might point to under-utilization of faster resolution channels.

Solution:
Optimize email support processes and explore promoting chat and phone channels for quicker resolutions.

Ticket Status Breakdown

Problem:
What proportion of tickets remain unresolved or open?

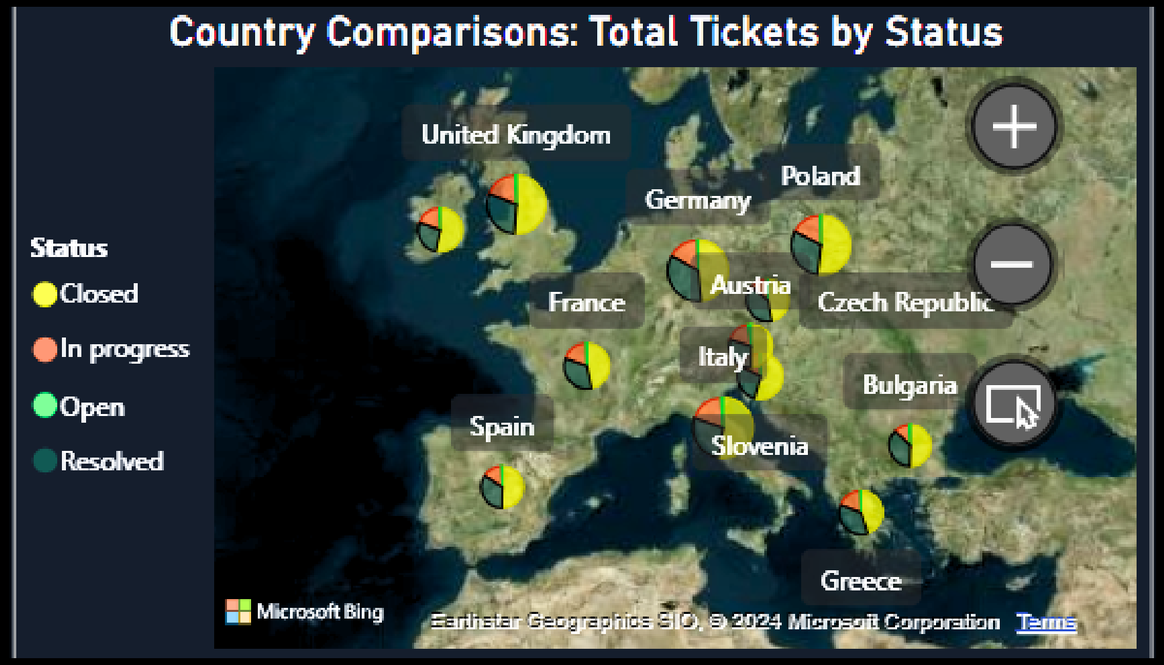


Insights:
50.34% Closed: Only half of the tickets are fully closed. A large portion (31.72%) is still in progress, and 17.17% are open.
Bottleneck Identified: In-progress tickets are taking too long to resolve, creating a backlog.

Solution:
Reevaluate the in-progress ticket queue and prioritize older tickets for resolution.

Country-Wise Ticket Analysis

Problem:
Which regions have the highest number of unresolved tickets?

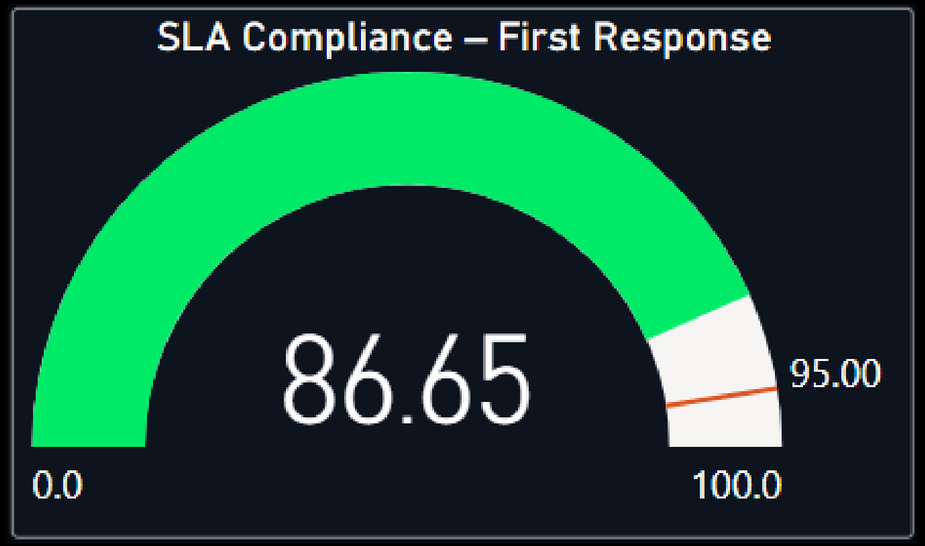


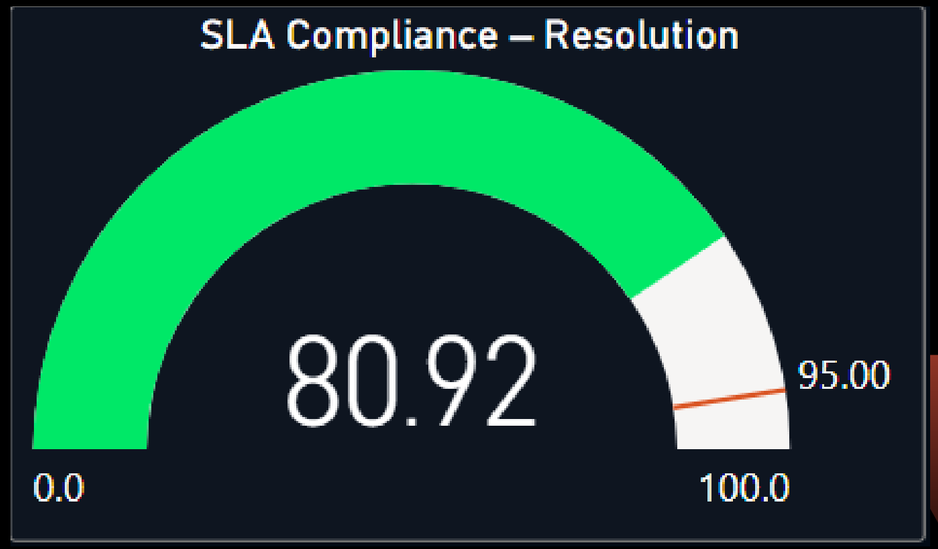
Insights:
Germany & Italy Lead in Ticket Volume: Germany and Italy have the highest ticket volumes, which might suggest higher product issues or support needs in these regions.
Geographic Trends: Some regions may need specialized support based on ticket volumes and types.

Solution:
Allocate regional specialists to countries with high-ticket volumes for faster resolutions.

SLA Compliance Dashboard

Problem:
How are we performing against SLA targets?



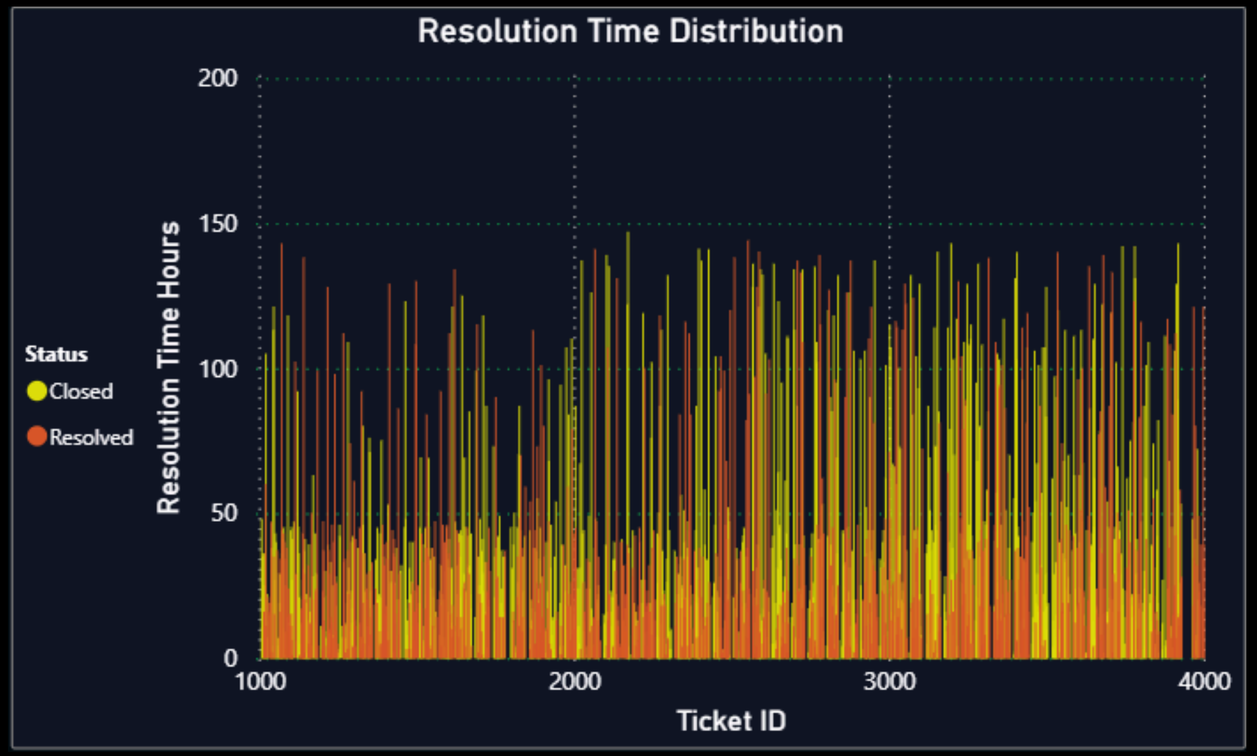


Insights:
86.65% First Response Compliance: There's room for improvement in first response times, especially in high-priority cases.
974 Breaches: A significant number of tickets (974) have breached SLA for both first response and resolution.

Solution:
Introduce stricter SLA monitoring and escalation processes to ensure that tickets meet their response and resolution deadlines.

Resolution Time Distribution

Problem:
How quickly are tickets being resolved?

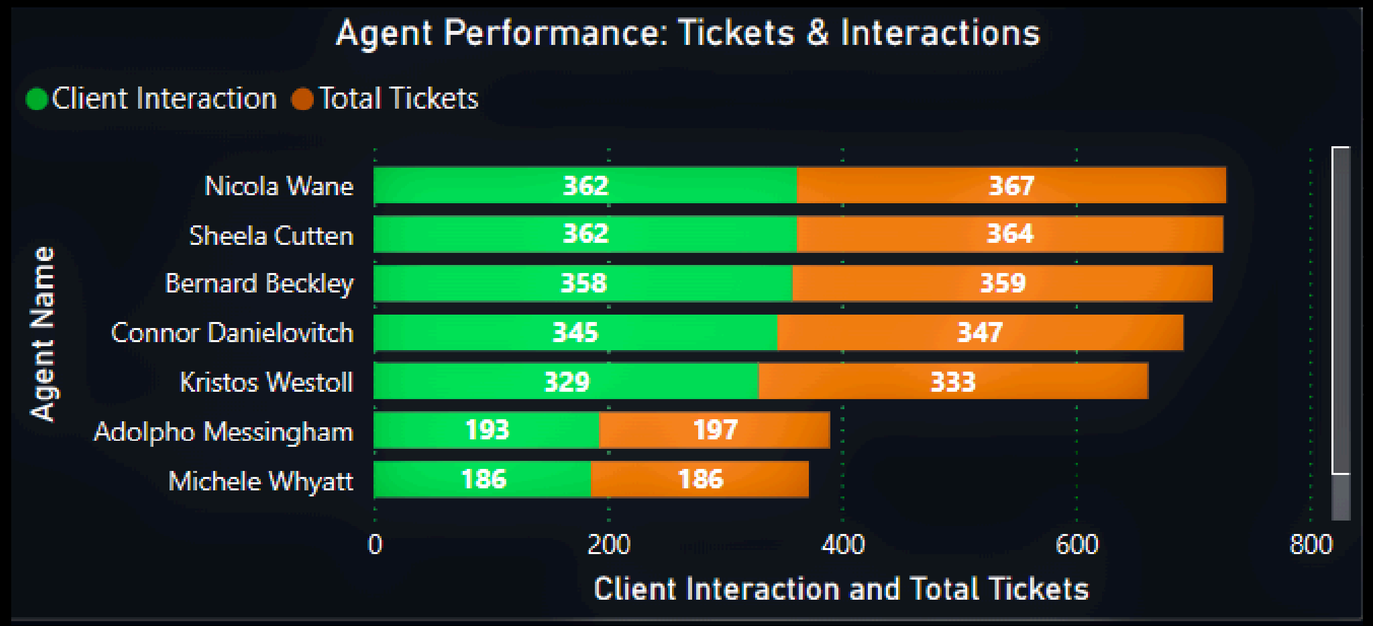


Insights:
Long Tail of Resolutions: Many tickets are resolved within 50 hours, but a small number stretch beyond 200 hours, delaying overall performance.
Outliers Identified: Delayed tickets are dragging down overall SLA performance.

Solution:
Focus on these outliers to bring them within reasonable resolution times and meet SLA targets.

Agent Performance Dashboard

Problem:
Are all agents performing equally?

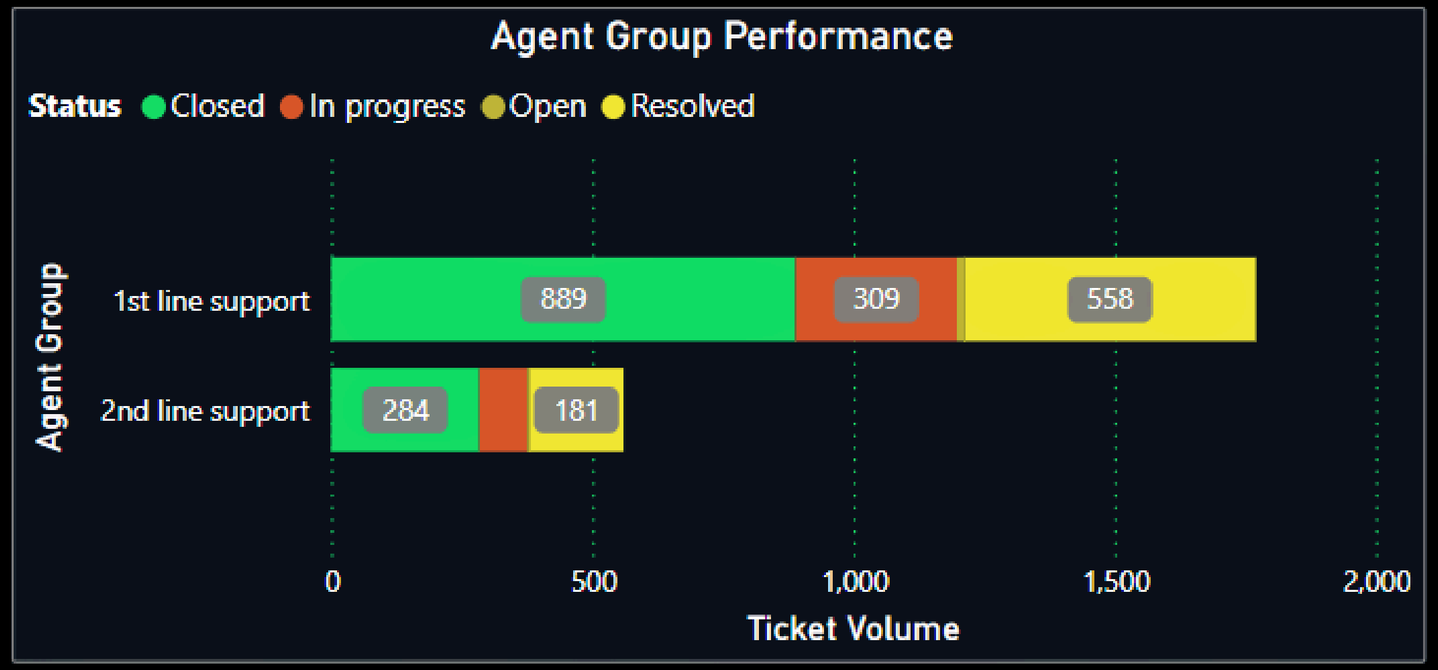


Insights:
Nicola Wane Leading: Nicola Wane has the highest number of tickets and interactions, indicating top performance.
Variability Among Agents: Some agents have higher client interactions but fewer resolved tickets, indicating inefficiency.

Solution:
Provide training to lower-performing agents and reassign high-performers to handle more complex tickets.

Agent Group Performance

Problem:
How are different agent groups handling tickets?



Insights:
1st Line Support handles the bulk of tickets, but 2nd Line Support is struggling with more complex tickets.
Resolution Bottleneck: Complex cases handled by 2nd line support are taking too long to resolve.

Solution:
Offer more resources or training to 2nd line agents to improve resolution speed for complex tickets.

Regional Customer Satisfaction Overview

Conclusion and Recommendations

Summary of Findings:

Ticket Volume: Higher during peak months and business hours. Adjust staffing accordingly.

SLA Compliance: 86.65% first response compliance; focus on improving resolution times and preventing breaches.

Agent Performance: Some agents excel, while others need training to handle higher volumes and complex tickets more efficiently.

Product Issues: Focus on product groups generating the most tickets to improve customer experience.

Next Steps:

Implement after-hours support.

Provide additional training for lower-performing agents and streamline high-priority ticket handling.

Address bottlenecks in complex ticket resolutions
